DETAILED ACTION

Specification

1. The numbering of claims is not in accordance with 37 CFR 1.126 which requires the original numbering of the claims to be preserved throughout the prosecution. When claims are canceled, the remaining claims must not be renumbered. When new claims are presented, they must be numbered consecutively beginning with the number next following the highest numbered claims previously presented (whether entered or not).

There are two claims numbered "6" *Claim Rejections - 35 USC § 103*

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 1-11 are rejected under 35 U.S.C. 103(a) as being unpatentable over JP2002263904.

'904 teaches a method for manufacturing a shaft-hub connection comprising the steps of : chucking in a first working piece spindle a brake disk having a hub and an aperture therein, chucking in a second working piece spindle a drive shaft having a bell and a catching portion adapted to extend into the aperture. (Abstract ; Figs. 1,3,4)

'904 fails to teach the steps of green machining via turning the brake disk;
green machining via turning the drive shaft; hardening the drive shaft;
final finishing via turning the brake disk; final finishing via turning the drive shaft;

Art Unit: 3726

whereby final dimensions of the brake disk and drive shaft are respectively obtained in a single chucking action.

But the steps of green machining via turning the brake disk;
green machining via turning the drive shaft; hardening the drive shaft;
final finishing via turning the brake disk; final finishing via turning the drive shaft;
whereby final dimensions of the brake disk and drive shaft are respectively obtained in a single chucking action, are well known in the art and It would have been obvious to one of ordinary skill in the art at the time the invention was made to employ these steps on the method of '904 so as to manufacture a firm connection between shaft and hub.

Regarding Claims 10 and 11, the rated/actual value deviation , and the size of wobble are considered to have been obvious matter of choice, since it has been held discovering an optimum value of a result effective variable involves only routine skill in the art. *In re Boesch*, 617 F.2d 272, 205 USPQ (CCPA 1980)
